

Sync or Sink — Global Salary Insights — Labor Market Analysis

This is a data-driven project that explores how different factors determine salary levels and market value. By analyzing and visualizing datasets, the project aims to reveal hidden insights, support strategic career decisions, and help professionals stay in sync with market trends.

Project Overview

Global Salary Insights is a business intelligence project built with Microsoft Power BI that dives deep into a massive dataset of 250,000 records. The project transforms raw compensation data into meaningful visualizations and KPIs, helping individuals and organizations identify trends, track pay scales, and pinpoint the impact of experience and education on income.

Data Model — Star Schema

The project is built on a well-structured Star Schema to ensure optimal performance and clean relationships between tables.

Fact_SalaryPerformance TableCore table containing annual salary, net compensation, tax rates, bonuses, and growth percentages.
Dim_Job Job details (job_title, industry, department, work_modality, required_skills).
Dim_Experience Professional background (years_of_experience, seniority_level, previous_roles).
Dim_Education Educational metrics (degree_level, certifications, field_of_study).|

Tools & Technologies

Tool	Purpose
------	---------

|--|--|

Power BI Desktop	Data modeling, DAX measures & visualizations
------------------	--

Star Schema	Data warehouse design pattern
-------------	-------------------------------

DAX	Custom measures and calculated columns
-----	--

Key Features

Clean Star Schema data model with proper relationships

Interactive dashboards for salary tracking and benchmarking

KPIs for average income, pay gaps, and industry performance

Work Modality analysis (Remote vs. Hybrid vs. On-site)

Drill-through capabilities for detailed job role insights
